

ABSTRACT OF THE DISCLOSURE

A closure for a container. The closure includes an annular skirt and a lid attached to the skirt by a living hinge, and a latch which releasably engages an outer surface of the skirt to hold the lid in a closed position. When the lid is in the closed position, an upper 5 surface of the lid is substantially coplanar with the living hinge and an upper surface of the skirt. The closure has an opening having an area which is substantially equal to the area of an opening of the container. The closure may be adapted for use with various types of existing container neck designs. The closure, including the skirt, lid, hinge and latch, is formed as an integral, one piece assembly.
